

Ledger

A private budget ledger by **XY Digital Media**.

Most budgeting apps tell you where your money went. This one tells you what you can actually spend today, and when you'll be able to afford the thing you're saving for.

What it does

- **Shows its work.** The balance isn't a mystery number. It's your bank balance, minus everything that hasn't cleared yet, with the arithmetic visible.
- **Handles charges the bank hasn't caught up to.** Log a purchase the moment you make it, dated whenever it happened. It comes off your available balance right away, and moves to history once it posts.
- **Forecasts day by day.** Every scheduled bill and paycheck, sixty days out, with the running balance after each one.
- **Free to spend before payday.** The lowest point your balance reaches before more money arrives — the number that actually tells you whether you can afford dinner out.
- **Recurring anything.** Daily, weekly, every two weeks, twice a month, monthly, every two months, or one time only. Each with an optional start and end date, so a loan that finishes in June stops showing up in July.
- **Categories and history,** grouped by month.

Privacy

This is the whole point of the product.

- No accounts, no sign-in, no servers.
- **Zero network requests.** No remote fonts, no analytics, no trackers, no telemetry. The app works with the device in airplane mode, permanently.
- Everything you enter is stored on your device and nowhere else.
- Your data is exportable as plain text at any time. It's yours; take it with you.

There is no backend to breach, because there is no backend.

Running it

One self-contained HTML file with no build step and no dependencies. Open `index.html` in any browser, or host it as a static site.

On a phone, open the hosted URL and add it to your home screen — it runs full screen and keeps your data on the device.

Roadmap

- **Goals** — name a purchase and a price, and get the date you can buy it without going short. Houses, moves, holidays, that cruise.
- **Bill reminders** via push notification.
- **Multiple accounts** — checking, savings, credit card.
- **Optional bank sync** as a paid add-on, for people who want it. Manual entry stays free and stays completely offline. Nobody is ever required to connect a bank to use this.
